| <b>Software Development Engineer Intern</b><br>Amazon - Business Payments Team<br>• Incoming Summer 2026                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | June 2026 – Sep 2026<br>Seattle, WA    |
| <b>Machine Learning Researcher</b><br>Caltech - Wierman Lab<br>• Researching diffusion-based approaches for constrained optimal power flow in energy system contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                     | April 2026 – Present<br>Pasadena, CA   |
| <b>Machine Learning Researcher</b><br>Caltech - Alvarez Lab<br>• Building custom autoencoder architecture to detect anomalous player behavior in Activision’s Call of Duty (COD) games, using SQL and Python to clean and process 3M+ raw gameplay logs, identifying 1000+ anomalous players within a 10-day window through reconstruction error.<br>• Designing a verification pipeline integrating UMAP + HDBSCAN clustering with temporal segmentation, identifying distinct types of anomalous behaviors and analyzing their impact on player engagement in 20,000+ players.                          | Feb 2025 – Present<br>Pasadena, CA     |
| <b>Machine Learning Intern</b><br>Tracevision - Math Team<br>• Automated data preprocessing pipelines and scripts to extract and construct 6000+ shot sequences from 80+ hours of raw basketball game footage centered around the basket, optimizing video format and quality for annotation teams through frame-level segmentation and noise reduction.<br>• Designed and deployed production-grade hybrid CNN + Transformer shot detection model, leveraging MobileNetV2 as the CNN backbone, achieving 95% accuracy on made vs. missed shot classification from annotated video clips.                 | Jun 2025 – Sep 2025<br>Los Angeles, CA |
| <b>Software Engineer Intern</b><br>Tracevision - Math Team<br>• Improved ptools, a full-stack internal tool for object tracking and annotation review, by optimizing components to boost efficiency and enhance usability for 100+ users - cutting detection load latency from 1.2s to 0.7s (~ 40% faster). Built with Python, MySQL, HTML/CSS, and JavaScript.<br>• Developed geospatial API deployment pipelines using a combination of custom scripts and AWS infrastructure (EC2, S3, Lambda), streamlining integration workflows for 30+ facilities and 100+ cameras in security and retail sectors. | Apr 2025 – Sep 2025<br>Los Angeles, CA |
| <b>Undergraduate Researcher</b><br>Caltech - Alvarez Lab<br>• Analyzed HIV patient datasets collected by the Multicenter AIDS Cohort Study (MACS) by applying causal ML and gradient boosting trees on 800+ patients, discovering significant epigenetic markers correlated with accelerated aging - currently authoring manuscripts on findings.<br>• Built data preprocessing pipeline merging epigenetic datasets with web-scraped environmental satellite data, performing data cleaning, imputation, and feature transformation for machine learning tasks downstream.                               | Apr 2024 – Dec 2024<br>Pasadena, CA    |
| <b>Undergraduate Researcher</b><br>Caltech - GALCIT Lab<br>• Developed a visual anemometry framework in MATLAB combining YOLOv3 object detection (95.4% precision) with optical flow mapping techniques to estimate wind speeds within $\pm 5$ m/s error.<br>• Conducted a quantitative analysis linking canopy motion variance to wind standard deviation across three different tree species, achieving >0.9 correlation in field tests.                                                                                                                                                                | Jun 2023 – Sep 2023<br>Pasadena, CA    |

SELECTED PROJECTS

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>TinyLM</b>   <i>Python, FastAPI, React, PyTorch</i><br>• Implemented a lightweight transformer-based language model (~22M total parameters) trained on TinyStories dataset. Includes custom BPE tokenization, dataset pipeline, training loop, and autoregressive text generation. Exposed inference through FastAPI backend for real-time prompting and querying.<br>• Designed a full-stack web interface with React connected to the FastAPI backend, enabling prompt-based interaction and live text generation.                                                                             |  |
| <b>Agentic Stock Trader</b>   <i>Python, LangChain, GCP, Gemini API</i><br>• Built a multi-agent stock trading framework where LLM-driven agents ingest 1,000+ financial news items, debate with each other, and output explainable decisions, achieving up to 2.34% monthly return for various individual stocks in backtests.<br>• Designed a recursive agent debate architecture with static personas, dynamic leaf agents, and hierarchical clustering, creating 50+ distinct agents across 3 debate layers and multiple decision rounds to systematically evaluate trades and reach agreement. |  |
| <b>Endless Runner Video Game</b>   <i>C, HTML/CSS, SDL</i><br>• Developed Google Dino Run-inspired endless runner game with obstacles, powerups, and progressive difficulty scaling. Written entirely in C using standard libraries.<br>• Implemented 100% unit test coverage for the physics engine. Reduced collision computation by ~40% overhead by restricting hitbox checks to active on-screen segments only.                                                                                                                                                                                |  |

ACTIVITIES/ACHIEVEMENTS

|                                          |            |
|------------------------------------------|------------|
| NCAA Division III Men’s Basketball       | 2024, 2025 |
| SCIAC All-Academic Team                  | 2024, 2025 |
| Hacktech Organizer - Caltech’s Hackathon | 2025, 2026 |
| National Merit Finalist                  | 2023       |
